

FEATURES

512K x 8 MRAM Memory

- Fast 35ns Read/Write Cycle
- SRAM Compatible Timing, Uses Existing SRAM Controllers Without Redesign
- Unlimited Read & Write Endurance
- Data Always Non-volatile for >20-years at Temperature
- One Memory Replaces Flash, SRAM, EEPROM and BBSRAM in System for Simpler, More Efficient Design
- Replace battery-backed SRAM solutions with MRAM to eliminate battery assembly, improving reliability
- 3.3 Volt Power Supply
- Automatic Data Protection on Power Loss
- Commercial, Industrial, Automotive Temperatures
- **RoHS-Compliant** SRAM TSOPII Package
- **RoHS-Compliant** SRAM BGA Package Shrinks Board Area By Three Times

INTRODUCTION

The **MR2A08A** is a 4,194,304-bit magnetoresistive random access memory (MRAM) device organized as 524,288 words of 8 bits. The MR2A08A offers SRAM compatible 35ns read/write timing with unlimited endurance. Data is always non-volatile for greater than 20-years. Data is automatically protected on power loss by low-voltage inhibit circuitry to prevent writes with voltage out of specification. The MR2A08A is the ideal memory solution for applications that must permanently store and retrieve critical data and programs quickly.

The **MR2A08A** is available in small footprint 400-mil, 44-lead plastic small-outline TSOP type-II package or 8 mm x 8 mm, 48-pin ball grid array (BGA) package with 0.75 mm ball centers. These packages are compatible with similar low-power SRAM products and other non-volatile RAM products.

The **MR2A08A** provides highly reliable data storage over a wide range of temperatures. The product is offered with commercial temperature (0 to +70 °C), industrial temperature (-40 to +85 °C), and automotive temperature (-40 to +125 °C) range options.

2. ELECTRICAL SPECIFICATIONS

Absolute Maximum Ratings

This device contains circuitry to protect the inputs against damage caused by high static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage greater than maximum rated voltages to these high-impedance (Hi-Z) circuits.

The device also contains protection against external magnetic fields. Precautions should be taken to avoid application of any magnetic field more intense than the maximum field intensity specified in the maximum ratings.

Table 2.1 Absolute Maximum Ratings¹

Parameter	Symbol	Value	Unit
Supply voltage ²	V_{DD}	-0.5 to 4.0	V
Voltage on an pin ²	V_{IN}	-0.5 to $V_{DD} + 0.5$	V
Output current per pin	I_{OUT}	± 20	mA
Package power dissipation	P_D	0.600	W
Temperature under bias MR2A08A (Commercial) MR2A08AC (Industrial) MR2A08AM (Automotive)	T_{BIAS}	-10 to 85 -45 to 95 -45 to 130	°C
Storage Temperature	T_{stg}	-55 to 150	°C
Lead temperature during solder (3 minute max)	T_{Lead}	260	°C
Maximum magnetic field during write MR2A08A (All Temperatures)	H_{max_write}	2000	A/m
Maximum magnetic field during read or standby	H_{max_read}	8000	A/m

¹ Permanent device damage may occur if absolute maximum ratings are exceeded. Functional operation should be restricted to recommended operating conditions. Exposure to excessive voltages or magnetic fields could affect device reliability.

² All voltages are referenced to V_{SS} .

³ Power dissipation capability depends on package characteristics and use environment.

Temperature under bias MR2A08A (Commercial) MR2A08AC (Industrial) MR2A08AM (Automotive) ^{iv}	T_A	0 -40 -40		70 85 125	°C

ⁱ There is a 2 ms startup time once V_{DD} exceeds $V_{DD, (min)}$. See **Power Up and Power Down Sequencing** below.

ⁱⁱ $V_{IH} (max) = V_{DD} + 0.3 V_{DC}$; $V_{IH} (max) = V_{DD} + 2.0 V_{AC}$ (pulse width ≤ 10 ns) for $I \leq 20.0$ mA.

ⁱⁱⁱ $V_{IL} (min) = -0.5 V_{DC}$; $V_{IL} (min) = -2.0 V_{AC}$ (pulse width ≤ 10 ns) for $I \leq 20.0$ mA.

^{iv} Automotive temperature profile assumes 10% duty cycle at maximum temperature (2-years out of 20-year life)

Power Up and Power Down Sequencing

MRAM is protected from write operations whenever V_{DD} is less than V_{WI} . As soon as V_{DD} exceeds $V_{DD, (min)}$, there is a startup time of 2 ms before read or write operations can start. This time allows memory power supplies to stabilize.

The \overline{E} and \overline{W} control signals should track V_{DD} on power up to $V_{DD} - 0.2$ V or V_{IH} (whichever is lower) and remain high for the startup time. In most systems, this means that these signals should be pulled up with a resistor so that signal remains high if the driving signal is Hi-Z during power up. Any logic that drives \overline{E} and \overline{W} should hold the signals high with a power-on reset signal for longer than the startup time.

During power loss or brownout where V_{DD} goes below V_{WI} , writes are protected and a startup time must be observed when power returns above $V_{DD, (min)}$.

¹ All write occurs during the overlap of \overline{E} low and \overline{W} low. Power supplies must be properly grounded and decoupled and bus contention conditions must be minimized or eliminated during read and write cycles. If \overline{G} goes low at the same time or after \overline{W} goes low, the output will remain in a high impedance state. After \overline{W} or \overline{E} has been brought high, the signal must remain in steady-state high for a minimum of 2 ns. The minimum time between \overline{E} being asserted low in one cycle to \overline{E} being asserted low in a subsequent cycle is the same as the minimum cycle time allowed for the device.

² All write cycle timings are referenced from the last valid address to the first transition address.

³ This parameter is sampled and not 100% tested. Transition is measured ± 200 mV from the steady-state voltage. At any given voltage or temperature, $t_{WLQZ}(\max) < t_{WHQX}(\min)$

6. REVISION HISTORY

Revision	Date	Description of Change
0	Oct 25, 2007	Initial Advance Information Release
1	Oct 29, 2007	Designate pin 23, 24, 42 of TSOPII as DC "Don't Connect" pins since these pins should remain floating at all times. Functional operation of E2 pin defined.
2	Sep 12, 2008	Reformat Datasheet for Everspin, Delete E2 pin Function, Add BGA Package Information Add Tape & Reel Part Numbers, Add Power Sequencing Info, Correct IOH Spec For VOH to -100 uA, Correct ac Test Conditions
3	Apr 10, 2009	Add typical and worst case current specifications
4	July 6, 2009	Changed datasheet from Preliminary to Production except where noted. Updated format.

Unless otherwise noted, this is a Production Product - This product conforms to specifications per the terms of the Everspin standard warranty. The product has completed Everspin internal qualification testing and has reached production status.
