

TPS22918 5.5-V, 2-A, 52-mΩ On-Resistance Load Switch

1 Features

- Integrated Single Channel Load Switch
- Ambient Operating Temperature: -40°C to $+105^{\circ}\text{C}$
- Input Voltage Range: 1 V to 5.5 V
- On-Resistance (R_{ON})
 - $R_{\text{ON}} = 52\text{ m}\Omega$ (typical) at $V_{\text{IN}} = 5\text{ V}$
 - $R_{\text{ON}} = 53\text{ m}\Omega$ (typical) at $V_{\text{IN}} = 3.3\text{ V}$
- 2-A Maximum Continuous Switch Current
- Low Quiescent Current
 - $8.3\text{ }\mu\text{A}$ (typical) at $V_{\text{IN}} = 3.3\text{ V}$
- Low-Control Input-Threshold Enables Use of 1 V or Higher GPIO
- Adjustable Quick-Output Discharge (QOD)
- Configurable Rise Time With CT Pin
- Small SOT23-6 Package (DBV)
 - $2.90\text{-mm} \times 2.80\text{-mm}$, 0.95-mm Pitch, 1.45 mm Height (with leads)
- ESD Performance Tested per JESD 22
 - $\pm 2\text{-kV}$ HBM and $\pm 1\text{-kV}$ CDM

2 Applications

- Industrial Systems
- Set Top Box
- Blood Glucose Meters
- Electronic Point of Sale

3 Description

The TPS22918 is a single-channel load switch with configurable rise time and configurable quick output discharge. The device contains an N-channel MOSFET that can operate over an input voltage range of 1 V to 5.5 V and can support a maximum continuous current of 2 A. The switch is controlled by an on and off input, which is capable of interfacing directly with low-voltage control signals.

The configurable rise time of the device greatly reduces inrush current caused by large bulk load capacitances, thereby reducing or eliminating power supply droop. The TPS22918 features a configurable quick output discharge (QOD) pin, which controls the fall time of the device to allow design flexibility for power down and sequencing.

The TPS22918 is available in a small, leaded SOT-23 package (DBV) which allows visual inspection of solder joints. The device is characterized for operation over the free-air temperature range of -40°C to $+105^{\circ}\text{C}$.

Device Information ⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TPS22918	SOT-23 (6)	$2.90\text{ mm} \times 1.60\text{ mm}$

(1) For all available packages, see the orderable addendum at the end of the datasheet.

5 Pin Configuration and Functions

Pin Functions

PIN		I/O	DESCRIPTION
NO.	NAME		
1	VIN	I	Switch input. Place ceramic bypass capacitor(s) between this pin and GND. See the Detailed Description section for more information.
2	GND	—	Device ground.
3	ON	I	Active high switch control input. Do not leave floating.
4	CT	O	Switch slew rate control. Can be left floating. See the Feature Description section for more information.
5	QOD	O	Quick Output Discharge pin. This functionality can be enabled in one of three ways. - Placing an external resistor between VOUT and QOD - Tying QOD directly to VOUT and using the internal resistor value (R_{PD}) - Disabling QOD by leaving pin floating See the Quick Output Discharge (QOD) section for more information.
6	VOUT	O	Switch output.

6 Specifications

6.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted) ⁽¹⁾ ⁽²⁾

		MIN	MAX	UNIT
V _{IN}	Input voltage	−0.3	6	V
V _{OUT}	Output voltage	−0.3	6	V
V _{ON}	ON voltage	−0.3	6	V
I _{MAX}	Maximum continuous switch current, ambient temperature = 70°C		2	A
I _{PLS}	Maximum pulsed switch current, pulse < 300 μs, 2% duty cycle		2.5	A
T _J	Maximum junction temperature		125	°C
T _{stg}	Storage temperature	−65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to network ground terminal.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1000

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

Over operating free-air temperature range (unless otherwise noted)

			MIN	MAX	UNIT
V _{IN}	Input voltage		0	5.5	V
V _{ON}	ON voltage		0	5.5	V
V _{OUT}	Output voltage			V _{IN}	V
V _{IH, ON}	High-level input voltage, ON	V _{IN} = 1 V to 5.5 V	1	5.5	V
V _{IL, ON}	Low-level input voltage, ON	V _{IN} = 1 V to 5.5 V	0	0.5	V
T _A	Operating free-air temperature ⁽¹⁾		−40	105	°C
C _{IN}	Input Capacitor		1 ⁽²⁾		μF

- (1) In applications where high power dissipation and/or poor package thermal resistance is present, the maximum ambient temperature may have to be derated. Maximum ambient temperature [T_{A(MAX)}] is dependent on the maximum operating junction temperature [T_{J(MAX)}], the maximum power dissipation of the device in the application [P_{D(MAX)}], and the junction-to-ambient thermal resistance of the part/package in the application (θ_{JA}), as given by the following equation: T_{A(MAX)} = T_{J(MAX)} − (θ_{JA} × P_{D(MAX)}).

- (2) Refer to [Application and Implementation](#) section

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TPS22918	UNIT
		DBV (SOT-23)	
		6 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	183.2	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	151.6	°C/W
R _{θJB}	Junction-to-board thermal resistance	34.1	°C/W
ψ _{JT}	Junction-to-top characterization parameter	37.2	°C/W
ψ _{JB}	Junction-to-board characterization parameter	33.6	°C/W

- (1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

6.5 Electrical Characteristics

Unless otherwise noted, the specification in the following table applies over the full ambient operating temperature $-40^{\circ}\text{C} \leq T_A \leq +105^{\circ}\text{C}$. Typical values are for $T_A = 25^{\circ}\text{C}$.

PARAMETER	TEST CONDITIONS	T_A	MIN	TYP	MAX	UNIT
$I_{Q, VIN}$ Quiescent current	$V_{ON} = 5\text{ V}, I_{OUT} = 0\text{ A}$	$V_{IN} = 5.5\text{ V}$	$-40^{\circ}\text{C to } +105^{\circ}\text{C}$	9.2	16	μA
		$V_{IN} = 5\text{ V}$		8.7	16	
		$V_{IN} = 3.3\text{ V}$		8.3	15	
		$V_{IN} = 1.8\text{ V}$		10.2	17	
		$V_{IN} = 1.2\text{ V}$		9.3	16	
		$V_{IN} = 1\text{ V}$		8.9	15	
$I_{SD, VIN}$ Shutdown current	$V_{ON} = 0\text{ V}, V_{OUT} = 0\text{ V}$	$V_{IN} = 5.5\text{ V}$	$-40^{\circ}\text{C to } +105^{\circ}\text{C}$	0.5	5	μA
		$V_{IN} = 5\text{ V}$		0.5	4.5	
		$V_{IN} = 3.3\text{ V}$		0.5	3.5	
		$V_{IN} = 1.8\text{ V}$		0.5	2.5	
		$V_{IN} = 1.2\text{ V}$		0.4	2	
		$V_{IN} = 1\text{ V}$		0.4	2	
I_{ON} ON pin input leakage current	$V_{IN} = 5.5\text{ V}, I_{OUT} = 0\text{ A}$	$-40^{\circ}\text{C to } +105^{\circ}\text{C}$			0.1	μA
R_{ON} On-Resistance	$V_{IN} = 5.5\text{ V}, I_{OUT} = -200\text{ mA}$	25°C		51	59	$\text{m}\Omega$
		$-40^{\circ}\text{C to } +85^{\circ}\text{C}$			71	
		$-40^{\circ}\text{C to } +105^{\circ}\text{C}$			78	
	$V_{IN} = 5.0\text{ V}, I_{OUT} = -200\text{ mA}$	25°C		52	59	$\text{m}\Omega$

7 Parameter Measurement Information

- (1) Rise and fall times of the control signal are 100 ns
- (2) Turn-off times and fall times are dependent on the time constant at the load. For TPS22918, the internal pull-down resistance R_{PD} is enabled when the switch is disabled. The time constant is $(R_{QOD} \parallel R_L) \times C_L$.

Figure 21. Test Circuit

Figure 22. Timing Waveforms

8 Detailed Description

8.1 Overview

The TPS22918 is a 5.5-V, 2-A load switch in a 6-pin SOT-23 package. To reduce voltage drop for low voltage and high current rails, the device implements a low resistance N-channel MOSFET which reduces the drop out voltage across the device.

The device has a configurable slew rate which helps reduce or eliminate power supply droop because of large inrush currents. Furthermore, the device features a QOD pin, which allows the configuration of the discharge rate of VOUT once the switch is disabled. During shutdown, the device has very low leakage currents, thereby reducing unnecessary leakages for downstream modules during standby. Integrated control logic, driver, charge pump, and output discharge FET eliminates the need for any external components which reduces solution size and bill of materials (BOM) count.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 On and Off Control

The ON pin controls the state of the switch. ON is active high and has a low threshold, making it capable of interfacing with low-voltage signals. The ON pin is compatible with standard GPIO logic threshold. It can be used with any microcontroller with 1 V or higher GPIO voltage. This pin cannot be left floating and must be driven either high or low for proper functionality.

8.3.2 Quick Output Discharge (QOD)

The TPS22918 includes a QOD feature. The QOD pin can be configured in one of three ways:

- QOD pin shorted to VOUT pin. Using this method, the discharge rate after the switch becomes disabled is controlled with the value of the internal resistance R_{PD} . The value of this resistance is listed in the [Electrical Characteristics](#) table.
- QOD pin connected to VOUT pin using an external resistor R_{EXT} . After the switch becomes disabled, the discharge rate is controlled by the value of the total resistance of the QOD. To adjust the total QOD resistance, [Equation 1](#) can be used:

$$R_{QOD} = R_{PD} + R_{EXT}$$

Where:

- R_{QOD} = Total output discharge resistance
- R_{PD} = Internal pulldown resistance
- R_{EXT} = External resistance placed between the VOUT and QOD pin. (1)
- QOD pin is unused and left floating. Using this method, there will be no quick output discharge functionality, and the output will remain floating after the switch is disabled.

The fall times of the device depend on many factors including the total resistance of the QOD, V_{IN} , and the output capacitance. When QOD is shorted to VOUT, the fall time will change over V_{IN} as the internal R_{PD} varies over V_{IN} . To calculate the approximate fall time of V_{OUT} for a given R_{QOD} , use [Equation 2](#) and [Table 1](#).

$$V_{CAP} = V_{IN} \times e^{-t/\tau}$$

Where:

- V_{CAP} = Voltage across the capacitor (V)
- t = Time since power supply removal (s)
- τ = Time constant equal to $R_{QOD} \times C_L$ (2)

The fall times' dependency on V_{IN} becomes minimal as the QOD value increases with additional external resistance. See [Table 1](#) for QOD fall times.

Table 1. QOD Fall Times

V_{IN} (V)	⁽¹⁾ FALL TIME (μ s) 90% - 10%, $C_{IN} = 1 \mu$ F, $I_{OUT} = 0$ A, $V_{ON} = 0$ V					
	$T_A = 25^\circ\text{C}$			$T_A = 85^\circ\text{C}$		
	$C_L = 1 \mu$ F	$C_L = 10 \mu$ F	$C_L = 100 \mu$ F	$C_L = 1 \mu$ F	$C_L = 10 \mu$ F	$C_L = 100 \mu$ F

1	230	1830	19625	210	1800	19270

(1) TYPICAL VALUES WITH QOD SHORTED TO VOUT

8.3.2.1 QOD when System Power is Removed

The adjustable QOD can be used to control the power down sequencing of a system even when the system power supply is removed. When the power is removed, the input capacitor discharges at V_{IN} . Past a certain V_{IN} level, the strength of the R_{PD} will be reduced. If there is still remaining charge on the output capacitor, this will result in longer fall times. For further information regarding this condition, see the [Shutdown Sequencing During Unexpected System Power Loss](#) section.

8.3.2.2 Internal QOD Considerations

Special considerations must be taken when using the internal R_{PD} by shorting the QOD pin to the VOUT pin. The internal R_{PD} is a pulldown resistance designed to quickly discharge a load after the switch has been disabled. Care must be used to ensure that excessive current does not flow through R_{PD} during discharge so that the maximum T_J of 125°C is not exceeded. When using only the internal R_{PD} to discharge a load, the total capacitive load must not exceed 200 μ F. Otherwise, an external resistor, R_{EXT} , must be used to ensure the amount of current flowing through R_{PD} is properly limited and the maximum T_J is not exceeded. To ensure the device is not damaged, the remaining charge from C_L must decay naturally through the internal QOD resistance and should not be driven.

8.3.3 Adjustable Rise Time (CT)

A capacitor to GND on the CT pin sets the slew rate of V_{OUT} . The CT capacitor will charge up until shortly after the switch is turned on and V_{OUT} becomes stable. Once V_{OUT} become stable, the capacitor will discharge to ground. An approximate formula for the relationship between CT and the slew rate is shown in [Equation 3](#):

$$SR = 0.55 \times CT + 30$$

where

- SR = slew rate (in μ S/V)
- CT = the capacitance value on the CT pin (in pF)
- The units for the constant 30 are μ S/V. The units for the constant 0.55 are μ S/(V $\times$ pF). (3)

This equation accounts for 10% to 90% measurement on V_{OUT} and does not apply for CT = 0 pF. Use [Table 2](#) to determine rise times for when CT = 0 pF.

Rise time can be calculated by multiplying the input voltage by the slew rate. [Table 2](#) contains rise time values measured on a typical device.

Table 2. Rise Time Table

CT $\times$ (pF)	RISE TIME (μ S) 10% - 90%, $C_L = 0.1 \mu$ F, $C_{IN} = 1 \mu$ F, $R_L = 10 \Omega$ (1)						
	VIN = 5 V	VIN = 3.3 V	VIN = 2.5 V	VIN = 1.8 V	VIN = 1.5 V	VIN = 1.2 V	VIN = 1 V

(1) Typical values at 25°C with a 25 V X7R 10% ceramic capacitor on CT.

As the voltage across the capacitor approaches the capacitor rated voltage, the effective capacitance reduces. Depending on the dielectric material used, the voltage coefficient changes. See [Table 3](#) for the recommended minimum voltage rating for the CT capacitor. If using $V_{IN} = 1.2$ V or 4 V, it is recommended to use the higher of the two CT Voltage ratings specified.

Table 3. Recommended CT Capacitor Voltage Rating

V_{IN} (V)	RECOMMENDED CT CAPACITOR VOLTAGE RATING (V)
1 V to 1.2 V	10
1.2 V to 4 V	16
4 V to 5.5 V	20

8.4 Device Functional Modes

Table 4 describes the connection of the VOUT pin depending on the state of the ON pin.

Table 4. VOUT Connection

ON	QOD CONFIGURATION	TPS22918 VOUT
L	QOD pin connected to VOUT with R_{EXT}	GND (via $R_{EXT}+R_{PD}$)
L	QOD pin tied to VOUT directly	GND (via R_{PD})
L	QOD pin left open	Open
H	Any valid QOD configuration	VIN

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

This section highlights some of the design considerations when implementing this device in various applications. A PSPICE model for this device is also available in the product page of this device on www.ti.com (See the [Device Support](#) section for more information).

9.2 Typical Application

This typical application demonstrates how the TPS22918 can be used to power downstream modules.

Figure 23. Typical Application Schematic

9.2.1 Design Requirements

For this design example, use the values listed in [Table 5](#) as the design parameters:

Table 5. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
V_{IN}	5 V
Load Current	2 A
C_L	22 μ F
Desired Fall Time	4 ms
Maximum Acceptable Inrush Current	400 mA

9.2.2 Detailed Design Procedure

9.2.2.1 Input Capacitor (C_{IN})

To limit the voltage drop on the input supply caused by transient in-rush currents when the switch turns on into a discharged load capacitor or short-circuit, a capacitor needs to be placed between VIN and GND. A 1 μ F ceramic capacitor, C_{IN} , placed close to the pins, is usually sufficient. Higher values of C_{IN} can be used to further reduce the voltage drop during high-current application. When switching heavy loads, it is recommended to have an input capacitor about 10 times higher than the output capacitor to avoid excessive voltage drop.

9.2.2.2 Output Capacitor (C_L) (Optional)

Because of the integrated body diode in the MOSFET, a C_{IN} greater than C_L is highly recommended. A C_L greater than C_{IN} can cause V_{OUT} to exceed V_{IN} when the system supply is removed. This could result in current flow through the body diode from VOUT to VIN. A C_{IN} to C_L ratio of 10 to 1 is recommended for minimizing V_{IN} dip caused by inrush currents during startup.

9.2.2.3 Shutdown Sequencing During Unexpected System Power Loss

Microcontrollers and processors often have a specific shutdown sequence in which power needs to be removed. Using the adjustable Quick Output Discharge function of the TPS22918, adding a load switch to each power rail can be used to manage the power down sequencing in the event of an unexpected system power loss (i.e. battery removal). To determine the QOD values for each load switch, first confirm the power down order of the device you wish to power sequence. Be sure to check if there are voltage or timing margins that must be maintained during power down. Next, consult QOD Fall Time Table in the [Quick Output Discharge \(QOD\)](#) feature description to determine appropriate C_{OUT} and R_{QOD} values for each power rail's load switch so that the load switches' fall times correspond to the order in which they need to be powered down. In the above example, we would like this power rail's fall time to be 4 ms. Using [Equation 2](#), to determine the appropriate R_{QOD} to achieve our desired fall time.

Because fall times are measured from 90% of V_{OUT} to 10% of V_{OUT} , the equation becomes:

$$.5 V = 4.5 V \times e^{-(4 \text{ ms}) / (R \times (22 \mu\text{F}))} \quad (4)$$

$$R_{QOD} = 83.333 \Omega \quad (5)$$

Refer to [Figure 7](#), R_{PD} at $V_{IN} = 5 \text{ V}$ is approximately 25 Ω . Using [Equation 1](#), the required external QOD resistance can be calculated:

$$83.333 \Omega = 25 \Omega + R_{EXT} \quad (6)$$

$$R_{EXT} = 58.333 \Omega \quad (7)$$

[Figure 24](#) through [Figure 29](#) are scope shots demonstrating an example of the QOD functionality when power is removed from the device (both ON and VIN are disconnected simultaneously). The input voltage is decaying in all scope shots below.

- Initial $V_{IN} = 3.3 \text{ V}$
- QOD = Open, 500 Ω , or shorted to VOUT
- $C_L = 1 \mu\text{F}$, 10 μF
- V_{OUT} is left floating

NOTE: V_{IN} may appear constant in some figures. This is because the time scale of the scope shot is too small to show the decay of C_{IN} .

Figure 24. Fall Time (t_F) at $V_{IN} = 3.3\text{ V}$

Figure 25. Fall Time (t_F) at $V_{IN} = 3.3\text{ V}$

Figure 26. Fall Time (t_F) at $V_{IN} = 3.3\text{ V}$

Figure 27. Fall Time (t_F) at $V_{IN} = 3.3\text{ V}$

Figure 28. Fall Time (t_F) at $V_{IN} = 3.3\text{ V}$

Figure 29. Fall Time (t_F) at $V_{IN} = 3.3\text{ V}$

9.2.2.4 VIN to VOUT Voltage Drop

The VIN to VOUT voltage drop in the device is determined by the R_{ON} of the device and the load current. The R_{ON} of the device depends upon the VIN conditions of the device. Refer to the R_{ON} specification of the device in the [Electrical Characteristics](#) table of this data sheet. When the R_{ON} of the device is determined based upon the VIN conditions, use [Equation 8](#) to calculate the VIN to VOUT voltage drop:

$$\Delta V = I_{LOAD} \times R_{ON}$$

where

- ΔV = voltage drop from VIN to VOUT
- I_{LOAD} = load current
- R_{ON} = On-resistance of the device for a specific V_{IN}

An appropriate I_{LOAD} must be chosen such that the I_{MAX} specification of the device is not violated. (8)

9.2.2.5 Inrush Current

Use [Equation 9](#) to determine how much inrush current will be caused by the C_L capacitor:

$$I_{INRUSH} = C_L \times \frac{dV_{OUT}}{dt}$$

where

- I_{INRUSH} = amount of inrush caused by C_L
- C_L = capacitance on VOUT
- dt = Output Voltage rise time during the ramp up of VOUT when the device is enabled
- dV_{OUT} = change in V_{OUT} during the ramp up of VOUT when the device is enabled (9)

The appropriate rise time can be calculated using the design requirements and the inrush current equation. As we are calculating the rise time (measured from 10% to 90% of V_{OUT}), we will account for this in our dV_{OUT} parameter (80% of $V_{OUT} = 4$ V).

$$400 \text{ mA} = 22 \text{ } \mu\text{F} \times 4 \text{ V}/dt \quad (10)$$

$$dt = 220 \text{ } \mu\text{s} \quad (11)$$

To ensure an inrush current of less than 400 mA, choose a C_T value that will yield a rise time of more than 220 μs . Consulting [Table 2](#) at $V_{IN} = 5$ V, $C_T = 220 \text{ } \mu\text{F}$ will provide a typical rise time of 650 μs . Inputting this rise time and voltage into [Equation 9](#), yields:

$$I_{Inrush} = 22 \text{ } \mu\text{F} \times 4 \text{ V} / 650 \text{ } \mu\text{s} \quad (12)$$

$$I_{Inrush} = 135 \text{ mA} \quad (13)$$

This inrush current can be seen in the [Application Curves](#) section. An appropriate C_L value should be placed on VOUT such that the I_{MAX} and I_{PLS} specifications of the device are not violated.

9.2.3 Application Curves

10 Power Supply Recommendations

The device is designed to operate from a V_{IN} range of 1 V to 5.5 V. This supply must be well regulated and placed as close to the device terminal as possible with the recommended 1- μ F bypass capacitor. If the supply is located more than a few inches from the device terminals, additional bulk capacitance may be required in addition to the ceramic bypass capacitors. If additional bulk capacitance is required, an electrolytic, tantalum, or ceramic capacitor of 1 μ F may be sufficient.

The TPS22918 operates regardless of power sequencing order. The order in which voltages are applied to V_{IN} and ON will not damage the device as long as the voltages do not exceed the absolute maximum operating conditions. If voltage is applied to ON before V_{IN} , the slew rate of V_{OUT} will not be controlled.

11 Layout

11.1 Layout Guidelines

V_{IN} and V_{OUT} traces should be as short and wide as possible to accommodate for high current.

The V_{IN} pin should be bypassed to ground with low ESR ceramic bypass capacitors. The typical recommended bypass capacitance is 1- μ F ceramic with X5R or X7R dielectric. This capacitor must be placed as close to the device pins as possible.

11.2 Layout Example

Figure 32. Recommended Board Layout

11.3 Thermal Considerations

For best performance, all traces must be as short as possible. To be most effective, the input and output capacitors must be placed close to the device to minimize the effects that parasitic trace inductances may have on normal and short-circuit operation. Using wide traces for VIN, VOUT, and GND helps minimize the parasitic electrical effects along with minimizing the case to ambient thermal impedance.

The maximum IC junction temperature should be restricted to 125°C under normal operating conditions. To calculate the maximum allowable dissipation, $P_{D(max)}$ for a given output current and ambient temperature, use [Equation 14](#):

$$P_{D(MAX)} = \frac{T_{J(MAX)} - T_A}{\theta_{JA}}$$

where

- $P_{D(MAX)}$ = maximum allowable power dissipation
- $T_{J(MAX)}$ = maximum allowable junction temperature (125°C for the TPS22918)
- T_A = ambient temperature of the device
- θ_{JA} = junction to air thermal impedance. Refer to the [Thermal Information](#) table. This parameter is highly dependent upon board layout.

12.5 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

12.6 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS22918DBVR	ACTIVE	SOT-23	DBV	6	3000	Green (RoHS & no Sb/Br)	CU SN	Level-2-260C-1 YEAR	-40 to 105	13MW	Samples
TPS22918DBVT	ACTIVE	SOT-23	DBV	6	250	Green (RoHS & no Sb/Br)	CU SN	Level-2-260C-1 YEAR	-40 to 105	13MW	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Body dimensions do not include mold flash or protrusion. Mold flash and protrusion shall not exceed 0.15 per side.
 - D. Leads 1,2,3 may be wider than leads 4,5,6 for package orientation.
 - E. Falls within JEDEC MO-178 Variation AB, except minimum lead width.

DBV (R-PDSO-G6)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
 - D. Publication IPC-7351 is recommended for alternate designs.
 - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
